                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               83
                                                                                                                                                                                          Glycobiology 13:IC-5C(2003).

-1- FUNCTION: Catalyzes the reaction that attaches fucose through an O-glycosidic linkage to a conserved serine or threonine residue in EGP domains (By similarity).

-1- CATALYTIC ACTIVITY: Transfers an alpha-L-fucosyl residue from GDP-beta-L-fucose to the serine hydroxy group of a protein acceptor.
-1- COFACTOR: Manganese (By similarity).
-1- PATHWAY: Glycosylation.
-1- SIMILARITY: Belongs to the glycosyltransferase 68 family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   24 MPAGSWDPAGYLLYCPCMGRFGNQADHFLGSLAFAKLLINRTLAVPFWIEYQHHKPPFTNL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            90
               -!- FUNCTION: Catalyzes the reaction that attaches fucose through an O-glycosidic linkage to a conserved serine or threonine residue in BGF domains (By similarity).
-!- CATALYTIC ACTIVITY: Transfers an alpha-L-fucosyl residue from GDP-beta-L-fucose to the serine hydroxy group of a protein acceptor.
-!- COFACTOR: Manganese (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           271 QCVGYSRSTATPLIMIMCLPDLKEIQRAVTLWVRALNARSVYIATDSESYVSEIQQLFKD

Submitted (13-MAY-2003) MIPS, Ingolstaedter Landstr.1, D-85764

Neulerberg, GERMAY.

Neulerberg, GERMAY.

Neulerberg, GERMAY.

Research Center (DKFZ); Email s.wiemann@dkfz-heidelberg.de; sequenced by AGOWA (Berlin/Germany) within the cDNA sequencing consortium of the German Genome Project.

This clone (DKFZ0451J114) is available at the RZPD in Berlin.

Please contact the RZED: Reseaucentrum, Heubnerweg 6, 14059

Berlin-Charlottenburg, GERMANY; Email: clone@tzpd.de Further information about the clone and the sequencing project is available at http://mips.gef.de/proj/CDNA/.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              LeupheThrGlylleSerPheSerAlaSerTyrArgGluGlnTrpSerGlnArgPheSer 160
                                                                                                                                                  This DNA encodes a human heart O-fucosyltransferase that can glycosylate an epidermal growth factor (ESP) domain of a polygeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, activated O-fucose residue. Inhibitors of O-fucosyltransferase, mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of C-fucosyltransferase, to promete survival of sensory (retinal) neurons. Probes based on EMF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-fucosyltransferase
                                                                                                                                                                                                                                                                                                                                              PheGlyAsnGlnAlaAspHisPheLeuGlySerLeuAlaPheAlaLysLeuLeuAsnArg 40
                                                                                                                                                                                                                                                                                                                                                                                                                    9
                                                                                                                                                                                                                                                                                                                                                                                                                                                       80
                                                                                               Human O-fucosyl:transferase able to glycosylate epidermal growth factor domains - useful for diagnosis and treatment of diseases involving overexpression of the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                   HisValSerTyrGlnLysTyrPheLysLeuGluProLeuGlnAlaTyrHisArgValIle

                                                                                                                                              The invention relates to human tumour-associated antigenic target (TAT) polypeptides, and their related nucleic acids. The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in mammals. The invention also relates to nucleic acid and polypeptide commands. The invention also relates to nucleic acids and polypeptide and polypeptide and polypeptide and polypeptide and expected and methods and compositions for the treatment or TAT polypeptide; and methods and compositions for the treatment or TAT polypeptide, mucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, carvical cancer, liver cancer, bladder cancer, pancreatic cancer, cervical cancer, cancer acids may further be used as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The method comprises determining the expression profile of a group of markers in a patient sample. The method is useful for determining the presence of leukaemia cells, its types or subtypes, and for the preparation of a medicament for treating leukaemia.
                                                                  Determining the subtype of leukemia cells and whether a patient sample contains leukemia cells or other cells, useful for treating leukemia, comprises determining the expression profile of a group of markers in a patient sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   160
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      200
                                                                                                   This represents the nucleotide sequence of the plasmid construct used for the expression of human heart O-fucosyltransferase. The human O-fucosyltransferase can glycosylate an epidermal growth factor (BGF) domain of a polypeptide with an activated O-fucose residue. Inhibitors of O-fucosyltransferase, e.g. mutants with increased affinity for the EFG domains, are used in diagnosis and treatment of conditions associated with overexpression of O-fucosyltransferase, to promote auravival of sensory (retinal) neurons. Probes based on EGF domain polypeptide are used to detect gene amplification and expression. The expression can also be determined at the protein level using antibodies specific for O-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       100
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The polymoclocides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 from the sequence listing were missing at the time of publication
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GlyAsnProPheGlyProPheTrpAspGlnPheHisValSerPheAsnLysSerGluLeu 141
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PheThrGlylleSerPheSerAlaSerTyrArgGluGlnTrpSerGlnArgPheSerPro 161

                                                                                                                                     The invention relates to polynucleotides (AAK51456-AAK53435) and the encoded polypeptides (AAM78323-AAM80302) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polymerides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, increment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. Note: Records for SEQ ID NO 2110 (AAK52581), 2111 (AAK52582) and 3666 (AAM80020) are omitted as the relevant pages from the sequence listing were missing at the time of publication
